Software Project Management
Assignment-10
TYPE OF QUESTION: MCQ/MSQ

Number of questions: **10** **Total mark: 10 X 1 = 10**

QUESTION 1:

Which of the following work products (such as code, design document, code, etc.) associated with the software continually change during the development as well as the maintenance phase?

a. SRS document
b. Data Flow Diagrams
c. UML Diagrams
d. Code
e. Test cases
f. All of these

Correct Answer: f. All of these

Detailed Solution:

During both development and maintenance, all software work products—SRS documents, Data Flow Diagrams, UML diagrams, code, and test cases—are subject to continual change. Requirements evolve, designs are refined, code is updated for bug fixes or enhancements, and test cases are modified to reflect new functionality or changes. Thus, all of these work products change throughout the software life cycle, making (f) the correct answer.

QUESTION 2:

Which one of the following is an important purpose of software configuration management?

a. To support efficient customer relationship management such as providing technical help and accepting bug reports
b. To avoid maintaining multiple copies of the same project files
c. To Keep track of which team member would perform which task and by when
d. To manage the workflow across the team members
e. To carry out feasibility study of the software to be developed

Correct Answer: b. To avoid maintaining multiple copies of the same project files

Detailed Solution:

Software Configuration Management (SCM) is primarily concerned with controlling changes and maintaining integrity of software artifacts. A key purpose is to avoid duplication and confusion by centrally managing versions of project files, preventing multiple uncontrolled copies. Customer relationship management (a), task assignment (c), workflow management (d), and feasibility studies (e) are outside the scope of SCM. Thus, (b) is correct.

QUESTION 3:

Which of the followings are usually NOT a work product category associated with a software development process?

a. Uncontrolled
b. Pre-controlled
c. Controlled
d. Post-controlled
e. Semi-controlled

Correct Answer: d. Post-controlled
e. Semi-controlled

Detailed Solution:

Standard SCM categories are Uncontrolled, Pre-controlled, and Controlled — representing the state of control over work products. Post-controlled is sometimes used informally but is not a core SCM category, and Semi-controlled is not a recognized term in formal SCM frameworks. Thus, both are usually NOT considered standard work product categories.

QUESTION 4:

Which one of the following statements is NOT correct regarding SCCS tool?

a. It stands for Source Code Control System.
b. It is a popular configuration management tool on UNIX systems.
c. It can be used for controlling and managing different versions of text files.
d. It can handle binary files.
e. It provides an efficient way of storing versions that minimize the amount of occupied disk space.

Correct Answer: d. It can handle binary files

Detailed Solution:

SCCS (Source Code Control System) is a UNIX-based version control tool designed primarily for text files (like source code). It stores changes efficiently by saving deltas (differences) between versions, which minimizes disk space. However, it does not handle binary files well—binary diffs are not efficiently stored, and SCCS is not suited for binary data. Thus, (d) is the statement that is NOT correct.

QUESTION 5:

Which of the following project management tools do not support portfolio management?

a. Ganttproject
b. Microsoft Project
c. ProjectLibre Desktop
d. Primavera
e. None of these

Correct Answer: a. Ganttproject
c. ProjectLibre Desktop

Detailed Solution:

GanttProject and ProjectLibre Desktop are desktop scheduling tools focused on individual project planning and Gantt charts; they lack strategic portfolio management capabilities.

QUESTION 6:

A system / software which is bought ‘as is’, is known as

a. Bespoke system
b. Off-the-shelf package
c. Customized off-the-shelf (COTS) software
d. Open source software
e. Free software

Correct Answer: b. Off-the-shelf package

Detailed Solution:

An off-the-shelf package is a software product purchased "as is," with no modifications or only minimal configuration, ready for immediate use. A bespoke system is custom-built, customized COTS involves modifications, and open source/free software refer to licensing, not the "as is" purchase model. Thus, (b) is correct.

QUESTION 7:

In fixed price per unit delivered contracts, how the price is calculated?

a. The price is fixed when the contract is signed.
b. The customer is charged at a fixed rate per unit of effort.
c. Function Point (FP) counting is used for calculating the price to be quoted.
d. The customer is charged based on the expected time to complete the project and the volume of materials needed.
e. The price varies dynamically.

Correct Answer: c. Function Point (FP) counting is used for calculating the price to be quoted.

Detailed Solution:

In a fixed price per unit delivered contract, the total price is determined by multiplying the number of functional units (e.g., function points) by a fixed rate per unit. Function Point counting is commonly used to measure the size of the software to be delivered, which then forms the basis for quoting the price. The price is not fixed upfront (a), nor is it based on effort (b), time and materials (d), or dynamic variation (e). Thus, (c) is correct.

QUESTION 8:

Which one of the following occurs in restricted tendering process?

a. Any supplier can bid in response to the invitation to tender
b. Bids are received only from those suppliers who have been specifically invited
c. Bids are received only from the local suppliers
d. Negotiation is made with only one supplier
e. Negotiation is made with a group of suppliers

Correct Answer: b. Bids are received only from those suppliers who have been specifically invited

Detailed Solution:

In restricted tendering (also called selective tendering), only a limited number of pre-qualified suppliers are invited to submit bids. This contrasts with open tendering (a), where any supplier can bid; local supplier restrictions (c) are not the basis; and negotiation with one supplier (d) or a group (e) describes single-source or negotiated tendering, not restricted tendering. Thus, (b) is correct.

QUESTION 9:

Which of the following are NOT services?

a. Equipment
b. Training
c. Documentation
d. Consumables
e. Transitional insurance arrangements
f. Providing telecommunication facilities
g. All of these

Correct Answer: a. Equipment
c. Consumables

Detailed Solution:

Services are intangible activities performed for a client—training, documentation (if custom-created), insurance arrangements, and providing telecom facilities all fall under services. Equipment and consumables (e.g., paper, ink, screws) are tangible physical goods, not services. Thus, (a) and (d) are correct. If your book treats documentation as a product rather than a service, it could also be included, but equipment and consumables are the clearest non-services.

QUESTION 10:

Which of the following are important reasons for not properly closing the projects?

a. Lack of interest by the project team
b. Underestimation of how fast know-how can get lost
c. Emotional factors
d. Indecision regarding project closure
e. Availability of a well-defined project closure process

Correct Answer: a. Lack of interest by the project team
b. Underestimation of how fast know-how can get lost
c. Emotional factors
d. Indecision regarding project closure

Detailed Solution:

Projects often fail to close properly due to team disinterest (a), underestimation of knowledge loss (b), emotional attachment (c), and indecision about when or how to close (d). In contrast, a well-defined project closure process (e) helps ensure proper closure—it is a solution, not a cause of improper closure. Thus, (a), (b), (c), and (d) are correct.
